                                                                                                                                                                                                                                                                                                                                                    code for the heavy chain (AAWI1917) and light chain (AAWI1918) of anti-human interleukin-1 beta (IL-1 beta) murine monoclonal anti-human interleukin-1 beta (IL-1 beta) murine monoclonal antibody (MAD) SK48-E26. They were obtd. from cDNA clones of the heavy and light chains derived from mRNA extracted from SK48-E26 hybridoma cells. They can be used in the prepn. of nucleic acids (see also AAT51438-39) coding for recombinant chimeric and humanised antibodies (see also AAWI1919-20) useful for the treatment and prevention of IL-1 mediated inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0; Gaps

It encodes kappa anticarcinoembryonic antigen chain. Using the vector the immunoglobulin is produced readily in pure monoclonal form. Genetic manipulations can be used to produce chimeras of variants drawing their homology from species differing from each other. Protein manipulation is also possible.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                136 ATCTGCATCTGTGGGAGAAACTGTCACCATGACATGTCGAGGAAGTGGGGAATATTCAAAA 195

fragments). The protein function to be inhibited is preferably p21(ras). It is especially inhibited by the monoclonal antibody Y13-259. This sequence represents the coding sequence for the light chain of the Y13-259 antibody. The method may be used to inhibit the activity of specific proteins in cells and eliminate undesirable biological responses, e.g. it may be used to treat conditions associated with the over-expression or overactivity of the target protein. In this way the method may be used to treat conditions have the method may be used to treat cancer and neoplasms, by targeting proteins

The cDNAs were incorporated into a finance resultant plant expression vector was used to transform the resultant plant expression vector was used to transform tobacco plants, anking them TMV resistant, the plants could also be biofarmed for the prodn. of anti-virus antibodies.
                                                                                                                                                                                                                                                        Anti-tobacco mosaic virus monoclonal Ab light chain cDNA.

MAb 55.1 (ECACC 93081901) recognises the colorectal tumor-associated antigen CA55.1. cDNAs for the heavy (AA094037) and light (AA094036) chains of 55.1 were isolated, and F(ab)', F(ab)2, Fab, Fv, scFv or V-min humanized 55.1 constructs have been expressed in myeloma
                                                                                                                                                                                                                                                                                                             Antigen binding structures containing CDRs recognising the CA55.1 antigen - produced by hybridomas and host cells, for use in the diagnosis and therapy of cancer

The invention relates to novel regulatory elements and vectors for the expression of one or more proteins in a host cell. The invention further expression of one or more proteins in a host cell. The invention further expression of a protein of interest, comprising providing the host cell transfected with a vector conformation protein of sequence comprising a signal protein and a encoding a polycistronic sequence comprising a signal protein and the desired protein is produced, where the tesignal protein and the desired protein is produced, where the conformant of proteins and vectors of the invention are useful for the Regulatory elements and vectors of the invention are useful for the expression of proteins of interest in a host cell. They are useful for expression of proteins of one or more proteins such as enythropoletin, useful in the expression of one or more proteins such as enythropoletin, useful in the expression of one or more proteins such as enythropoletin, useful in the expression of one or more proteins such as enythropoletin, useful in the expression of one or more proteins such as enythropoletin, useful in the expression of one or more proteins such as enythropoletin, or growth hormones, von Willebrands factor, lung surfactors, form comes, von willebrands factor, interferors, or growth factors, rheumatoid factors, nerve growth factors, or growth factors, rheumatoid factors, interferors for allowing factors, immunotoxins, bone morphogenetic copproteins, osteoinductive factors, immunotoxins, bone morphogenetic copproteins, osteoinductive factors, immunotoxins, bone morphogenetic copprise and simulates, really addressins, required for expressing cortein, interferons, colony stimulating factors, interleukins, supercoiled simulates, really addressins, addressins, required for expressing crantibodies, chimeric proteins and their fragments proteins in mammalian tissue culture host cells, the rectors are useful for expressing comprises the following elements: bovine/human alpha-lactalbumin (LA) Bot vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel regulatory elements including nucleic acid encoding hybrid alpha-lactalbumin promoter or mutant RNA export element, for expressing one or more proteins e.g. antibodies, pharmaceutical proteins in host
                                                                                                                                                                                                                                                                                             "Bot antibody heavy chain Fab coding region"
                                                                                       product= "Bot antibody light chain Fab coding region"
                                                                                                                                                                                                                /product= "Bovine alpha-lactalbumin signal peptide

Host cell for producing a desired protein and for screening compounds useful for pharmaceutical, industrial, diagnostic and other purposes, comprises multiple integrating vectors having an exogenous gene -WPI; 2002-154737/20.

Example 3; Fig 15; 191pp; English.

The invention relates to a host cell comprising a genome having at least two integrated integrating vectors. The integrating vectors comprise at least one exogenous gene operably linked to a promoter. The host cell is useful for producing a desired protein and for comparing protein functions. The host cells comprises a reporter gene which is from gene fluorescent protein, luciferase, beta-galactosidase and beta-lactamase,

```
and the assaying step further comprises detecting a signal from the reporter gene. The desired protein includes proteins for pharmaceutical, industrial, diagnostic and other purposes. The host cells is useful for indirectly detecting the expression of a desired protein, comprising providing the host cell transfected with a vector encoding a providing the host cell transfected with a vector encoding a polycistronic sequence comprising a signal protein and a desired protein polycistronic sequence comprising a signal protein and the host cell under suitable conditions so that the signal protein and the desired protein is produced, where the presence of signal protein inflicates the presence of desired protein. The present sequence is LNBOTDC vector used in the invention. The vector comprises the following elements: moloney murine leukemia virus (MoMuLV) 5' LTR, MoMuLV extended elements: moloney murine leukemia virus (ECWV), modified bovine alpha-lactalbumin from encephalomyocarditis virus (ECWV), modified bovine alpha-lactalbumin signal peptide coding region, Bot Fab5 heavy chain, and moloney murine leukemia virus (MoMuLV) 3' LTR.

Novel regulatory elements including nucleic acid encoding hybrid alpha-lactalbumin promoter or mutant RNA export element, for expressing one or more proteins e.g. antibodies, pharmaceutical proteins in host

Example 3; Fig 16; 151pp; English.

The invention relates to novel regulatory elements and vectors for the expression of one or more proteins in a host cell. The invention further provides methods of indirectly detecting the expression of a protein of providing providing the host cell transfected with a vector desired protein operably linked by an internal ribosome entry site (TRES), and culturing the host cell under suitable conditions so that the signal protein indicates the presence of signal protein indicates the presence of desired protein. CC Regulatory elements and vectors of the invention are useful for the expression of proteins of interest in a host cell. They are useful for the producing an immunoglobulin (19), preferably secretory 19. They are useful for the consecution in the expression of one or more proteins such as erythropolatin, immunoalism is immunosibility. growth hormone, insulin, immunoglobulins, protein C, cytokines and their albumins, DNase, vascular endothelial growth factor, receptors for CD proteins, Osteoinductive factors, nerve growth factors, rheumatoid factors, nerve growth factors, proteins, osteoinductive factors, immunotoxins, bone morphogenetic protein, interferons, colony stimulating factors, interleukins, viral antigens, transport proteins, addressins, regulatory proteins, antibodies, chimeric proteins, addressins, regulatory proteins, particularly useful for expressing G protein coupled receptors and their frammembrane proteins; the retroviral vectors and expressing frammembrane proteins. proteins in mammalian tissue culture host cells, including rat fibroblast cells, bovine kidney cells and human kidney cells. The present sequence is LNBOTOC vector used in the invention. The vector comprises the following elements: moloney murine leukemia virus (MOMULV) 5' LTR, MOMULV extended viral packaging region, neomycin phosphotransferase gene, CMV promoter, cc49 signal peptide coding region, bot Fab 5 light chain, IRES sequence from encephalomyocarditis virus (ECMV), modified bovine alphalactalbumin signal peptide coding region, Bot Fab5 heavy chain and moloney murine leukemia virus (MOMULV) 3' LTR.

```
The invention relates to a host cell comprising a genome having at least two integrated integrating vectors. The integrating vectors comprise at two integrated integrating vectors. The host cell least one exogenous gene operably linked to a promoter. The host cell is useful for producing a desired protein and for comparing protein functions. The host cells comprises a reporter gene which is from gene fluorescent protein, luciferase, beta-galactosidase and beta-lactamase, and the assaying step further comprises detecting a signal from the reporter gene. The desired protein includes proteins for pharmaceutical industrial, diagnostic and other purposes. The host cells is useful for indirectly detecting the expression of a desired protein, comprising providing the host cell transfected with a vector encoding a providing the host cell transfected with a vector encoding a polycistronic sequence comprising a signal protein and a desired protein in produced, where the presence of signal protein and the desired protein is produced, where the presence of signal protein and LSRNL vector used in the invention. The vector comprises the following collections and the signal protein and collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the collections of the colle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2641 ATCAGGAACACAATATTCTCTCAAGATCAACAGCCTGCAGCCTGAAGATTTTGGGAGTTA 2700

                                                                              This sequence represents the cDNA coding for the light and heavy chain of BotFab 22, a murine recombinant antibody fragment (rFab) specific to botulinum toxin types A and B. A cDNA library was made from mouse mRNA isolated from mice immunised with human pentavalent toxoid. The cloned mouse heavy and light chains were expressed in phage display libraries and screened for their ability to bind to botulinum toxin types A or B. The clones were then isolated and sequenced. Botulinum neurotoxin is produced as several antigenically distinct serotypes (A-G) and is non-covalently associated with non-neurotoxic proteins. The rFab of

neurotoxin complexes A and B. Such antibody fragments are able to act as immunosensors for detecting botulinum toxins in food and are also useful in health care and in military applications. They are less expensive to produce than monoclonal antibodies as they can be isolated from large scale bacterial cultures. Also, the affinity of an read may be altered by mutagenesis of its gene and subsequent screening this invention binds to the non-neurotoxic proteins that are found in

Sequence 1644 BP; 438 A; 446 C; 402 G; 358 T; 0 other;

This sequence represents the cDNA doding for the light and heavy chain of BotFab 5, a murine recombinant antibody fragment (rFab) specific to botulinum toxin types A and B. A cDNA library was made from mouse mRNA isolated from mice immunisade with himman pentavalent toxoid. The cloned mouse heavy and light chains were expressed in phage display libraries of and screened for their ability to bind to botulinum toxin types A or B. The clones were then isolated and sequenced. Botulinum meurotoxin is produced as several antigenically distinct serotypes (A-G) and is conn-covalently associated with non-heurotoxic proteins. The Frab of neurotoxin oranglexes A and B. Such Antibody fragments are able to act as immunosensors for detecting botulinum toxins in food and are also useful in health care and in military applications. They care less expensive to produce than monoclonal antibodies as they can be read and large scale bacterial cultures. Also, the affinity of an refer the corners of the contagenesis of its gene and subsequent screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       51 IGCTCACTCAGGTCCTGGCGTTGCTGQTGCTGTGGCTTACAGGTGCCAGATGTGACATCC 110

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δ
```

ö

Murine anti-botulinum toxin antibody fragment (BotFab 5) cDNA.

AAX86664 standard; cDNA; 1672

SULT 14

20-OCT-1999 (first entry)

A cDNA library was made from mouse mRNA soluted from mice immunised with human pentavalent toxoid. The

                                                                                                                            act as immunosensors for detecting botulinum toxins in food and they are also useful in health care and in military applications. They are less expensive to produce than monoclonal antibodies as they can be isolated from large scale bacterial cultures. Also, the affinity of an Irea, may be altered by mutagenesis of its gene and subsequent screening
                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  associated with non-neurotoxic proteins. The reads of this invention bind to the non-neurotoxic proteins that are found in neurotoxin complexes A and B. The antibody fragments are able to
                                                                                                                                                                                                                                                                                                                    ó
cloned mouse heavy and light chains (AAX86664) were expressed iphage display libraries and screened for their ability to bind to botulinum toxin types A or B. The clones were then isolated and sequenced. Botulinum neurotoxin is produced as several antignically distinct serotypes (A-G) and is non-covalently
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    711 CACCCATTGTCAAGAGCTTCAACAGGAATGAGTGTTAGAGACAAAG 756

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
